Yauga growth and retention strategy

How Yauga's live experiences bring people in and the rest of the ecosystem gives them a reason to stay, from the front door to the ring and back.

Overview of our idea

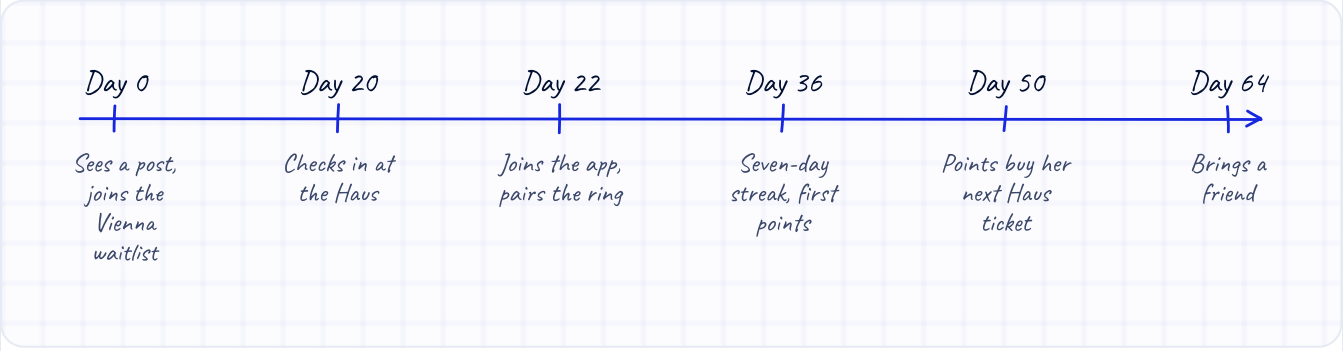

Picture Ada, who sees a Vienna creator's post about Yauga Haus, joins the waitlist on Yauga's website and three weeks later walks into her first evening at the Haus. She goes home feeling better than she has in weeks, and then nothing happens, because the Haus knows she came but nothing in the rest of Yauga uses that to give her a reason to come back.

Yauga has built far more than a venue, with product lines that run from the Haus Network and the platform behind it to the app, the Yauga Cult ring, connected products for the home and Yauga Enterprise, and the idea behind all of them fits in one line:

> **Live experiences acquire people. The ecosystem gives them a reason to stay.**

What is missing is the thread between them. Only the Haus and Yauga Letters send email today, so a person who comes to a Haus and then starts practising in the app is still a stranger to the rest of Yauga, and every product has to win them over again on its own.

We are coming to Yauga as a partner for growth and retention, so this is a strategy for the whole ecosystem rather than an email plan. Our idea is to turn Yauga into a culture people belong to: we learn who a person is at the front door and add to it at every step, give them something to keep up every day and a city to belong to, and only ever talk to them about what they did. Email is one of the ways we do that, and OnchainSuite is the tool we would run it on.

None of this is a new idea, and parkrun is the clearest proof we know of that it works for live, local gatherings.

Case study: parkrun

It started on 2 October 2004 as a time trial in Bushy Park, London, with 13 runners

Every runner has one barcode, so every run at every event adds to one record

Each runner is emailed their result on the same day as the run

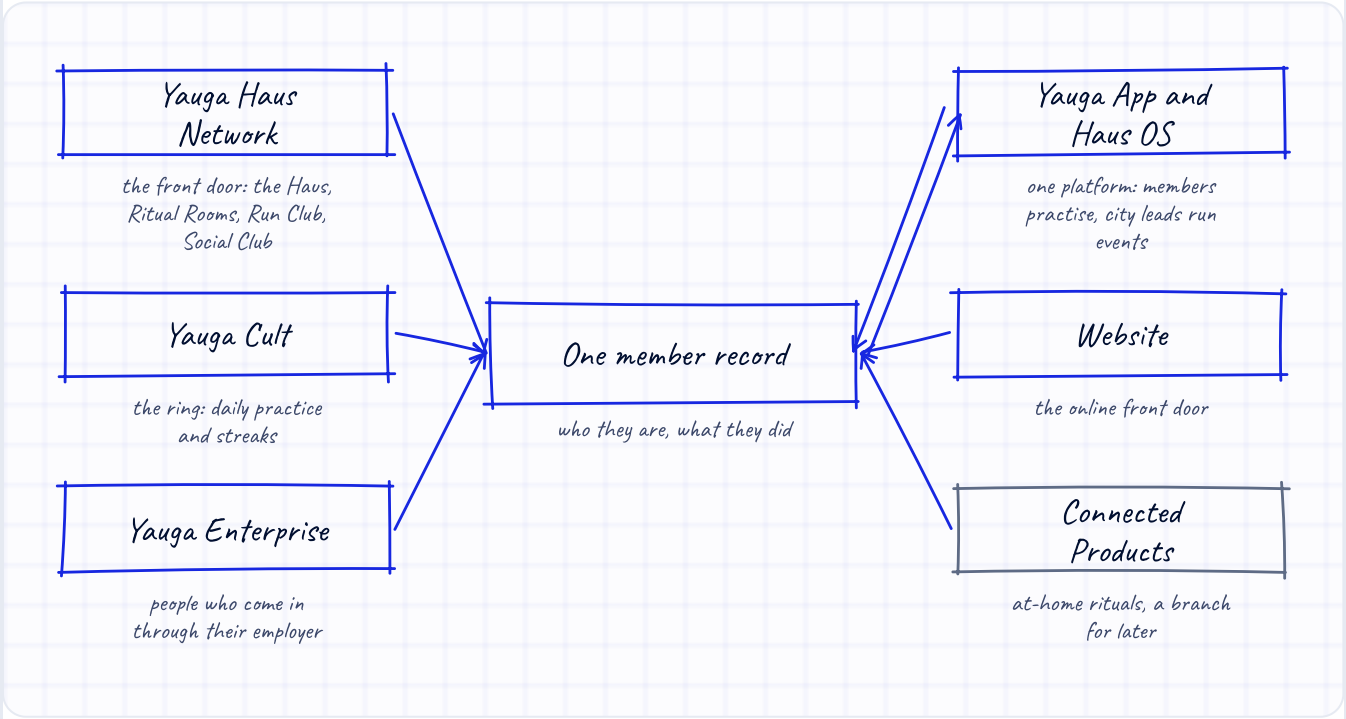

Milestones at 25, 50, 100, 250 and 500 runs give people a reason to come back next week

It now runs at more than 2,000 locations in over 20 countries, with more than ten million people registered

What parkrun does is simple: it keeps one record per runner, tells them the same day what they did, marks their milestones and gives them a park full of people who expect them back, without ever chasing them. Yauga already has the live experience that makes this work, so what would the same thing look like across the whole of Yauga?

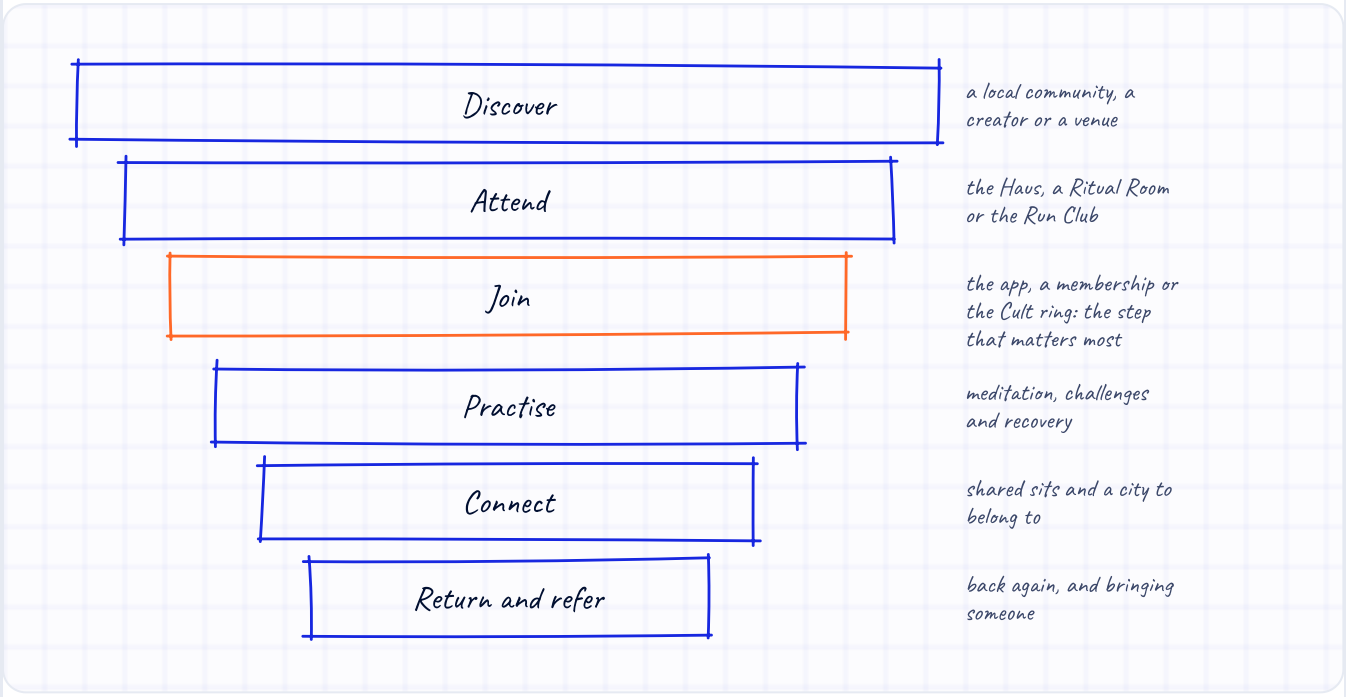

Yauga retention and growth strategy

The strategy has one aim, which is that once a person comes through Yauga's front door, every product they touch gives them a reason to stay and tells Yauga a little more about them. It starts from Yauga's product lines, with the record of each member between them:

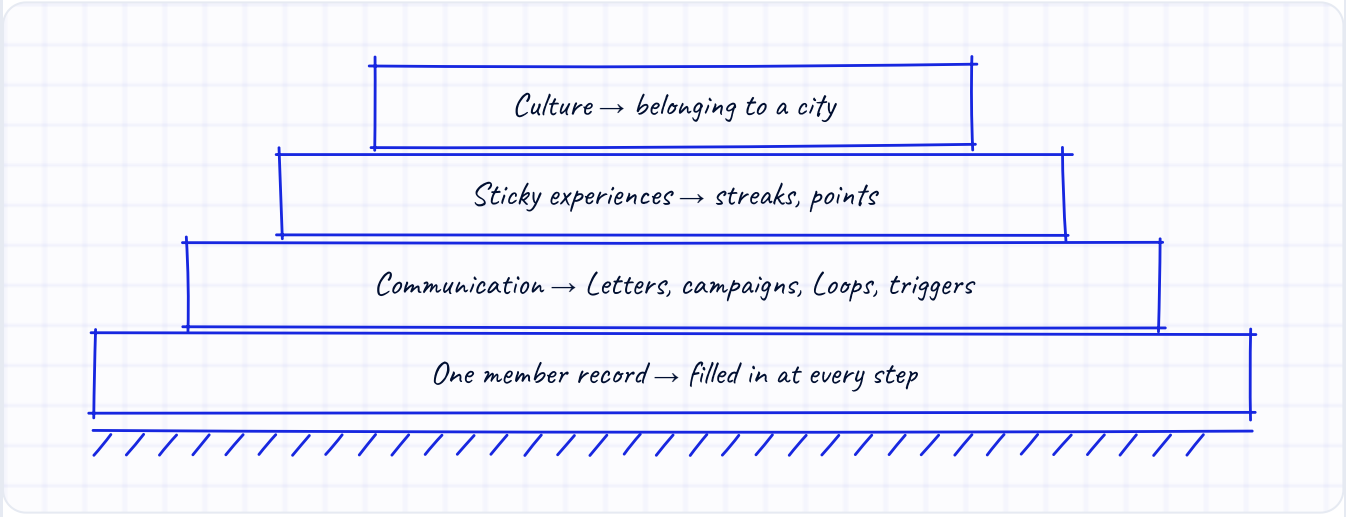

The Yauga App and Haus OS are one platform with different permissions, so a city lead creates and runs events while a member books, practises and holds a membership, and both report into the

same record. Every person moves round the same loop:

Every turn of the loop runs on four layers, with the member record at the bottom because everything above it depends on how well we know the person:

The record and the communication run on OnchainSuite, while the sticky experiences and the culture live in Yauga's own products and Hauses, and we would design them with Yauga's team. We would build it in three steps:

> The front door, where the website and the Haus fill one record, with Yauga Letters and the Welcome and After the Haus Loops
>
> The daily habit, where the app and the ring bring streaks, points, the First practice Loop and the retention triggers

> Belonging and return, with city milestones, referrals, the lifecycle stages and the Slipping, Bring someone and Dormant Loops

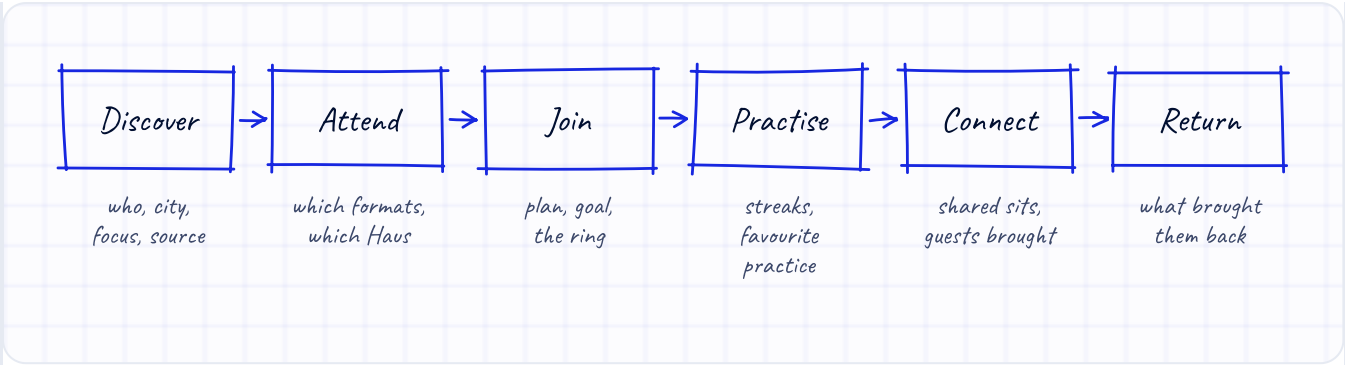

Yauga Enterprise and the connected products join the same record when they are ready, so nothing has to be rebuilt for them. The first step decides how well every later one works, so what should Yauga ask a person when they first arrive?

The front door

Yauga has two front doors. The website is where people arrive online, from a creator's post, a friend or a search, and the Haus is where they really come in, because nobody becomes part of Yauga without being in the room. Both fill the same record, and every source gets a tag, so we can see which creators, venues and communities bring in people who stay.

Where	What we ask	Why
The website	Name, email, city and focus, with a phone number optional	Enough to welcome them, add them to their city and send the right first practice
Booking a ticket	The event, and a tick for Yauga's news	What they came for, and what we may send
Check-in at the Haus	Nothing new, because the check-in is the signal	The moment the rest of the loop depends on
The app and a membership	Their goal and their plan	Which practices to suggest, and what they have joined
The Cult ring	A delivery address, when they buy it	The one place an address is needed
Yauga Enterprise	Their employer, as a source	So people who come in through work get the same welcome

We ask for each thing once, at the step that needs it, and use everything we ask for. A home address on the website form would cost sign-ups and give us nothing to send, and European privacy law asks for only what is needed, so it waits for the ring. After the front door, the record grows on its own from what people do:

Each door also sets what we may send. The website forms, and an opt-in tick at booking or at app sign-up, carry news consent confirmed by email, while a ticket bought without the tick carries service only, so that person gets their ticket and event follow-ups but never Letters, launches or city news. Where nobody can show what the people on Yauga's existing Haus list agreed to, the first email asks.

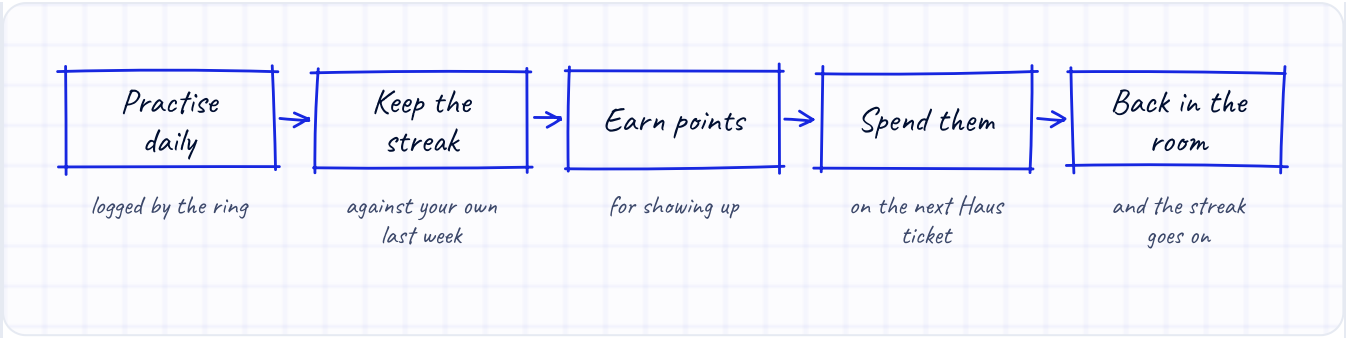

A full record tells us who someone is, so what gives them a reason to come back tomorrow?

Streaks, points and rewards

The Cult ring is connected to the app, which makes it the natural home for a daily habit. A member keeps a streak by practising each day, measured against their own last week rather than against anyone else, and the streak earns points they can spend on the things that bring them back to the room.

Earns points	Spends points
A day's practice, logged by the ring	A ticket to the next Haus in their city
A seven-day streak, or a challenge completed	A Ritual Room or Run Club session
A check-in at a Haus	Something from the Yauga store
Bringing someone who checks in	A partner brand's reward, once partners are signed

These are worked examples, and Yauga sets what each one is worth, because the balance lives in the Yauga App. The loop we want is the one below, where the reward for practising at home is a reason to be back in the room:

How the points stay healthy

Points reward showing up and never a body reading, so nobody is rewarded for a sleep score or a heart rate

One rest day a week keeps a streak alive, because recovery is part of the practice

The best rewards bring people back to a Haus, so the points feed the live experience rather than replacing it

Partner brands come later, so a member can keep a streak and earn points through a partner's class or product once Yauga's own rewards have shown they bring people back

OnchainSuite hears when points are earned and spent, never the readings behind them, and tells a member when a reward is within reach. A streak keeps one person coming back, but a movement needs people to come back for each other, so what makes a city feel like it belongs to its members?

A city to belong to

At parkrun, people come back for the same faces every Saturday as much as for their times, and Yauga already has what that needs, with a Haus in each city, a city lead and shared sits. The strategy is to make that belonging something members can see:

Idea	What it looks like
City identity	Members belong to Yauga Vienna or Yauga Chicago, and the app shows how much their city practised this week
Shared sits	A time each week when the whole city practises together, at the Haus or at home
Milestones	The 10th, 25th and 50th check-in, marked by the city lead at the Haus, the way parkrun marks its milestone runs
Bring someone	A guest pass after a member's third check-in, with points when the guest checks in
Creators and venues	Each has its own sign-up link, so the people who bring others in get the credit

> A member who belongs to a city comes back for the people in it.

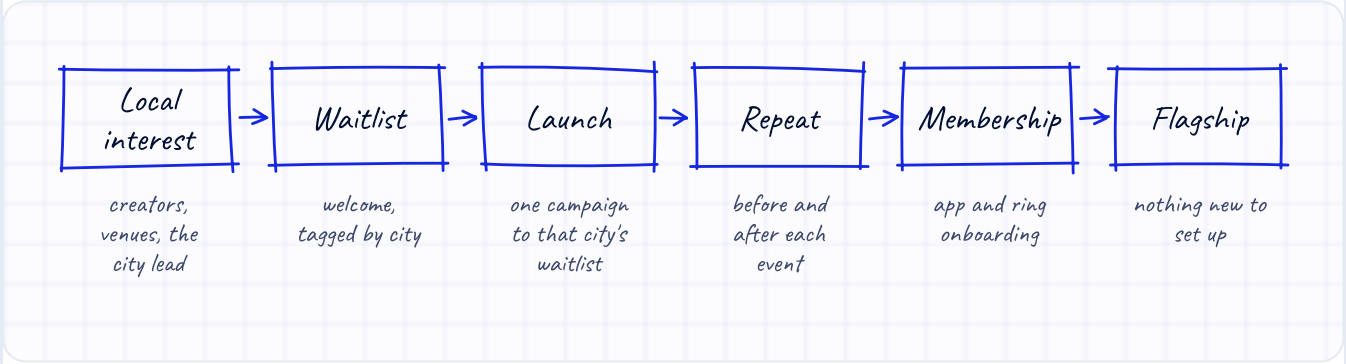

City leads are the local voice, and their news goes out through HQ in the same voice as everything else, so a member hears one Yauga wherever they are. Each of these moments is also a reason to say something to a member, and the next four pages cover how we say it.

Campaigns and newsletters

Communication has four parts, which the next pages take one at a time: campaigns and newsletters for what is happening in a city, Loops for one member's next step, lifecycle for where each member stands, and retention triggers for moments on a member's own account. All four go out by email, with one broadcast a week at most, and every email passes the Yauga Test.

A campaign goes to a tag, because something is happening for the people who carry it, and since a city is only a tag, the same system runs every city from one workspace. A member who moves from Bournemouth to Barcelona stays one person with one history, and Chicago and Vienna get separate sends in their own time.

Send	Goes to	When and how
City launch	That city's waitlist	One campaign, when the city opens
Before an event	The event's ticket tag	What to bring and how to arrive ready, unless Haus OS sends a reminder two days out
City news	The city tag	Written by the city lead and sent by HQ, from the same sender as everything else
Yauga Letters	Everyone with the letters tag	Once a week, one broadcast split by focus and city

Yauga Letters carries the member's pillar, whether that is sleep and Tranquility, stress and Stillness, attention and Attention, or movement and Energy, beside what is on in their city. Selling Yauga Enterprise to employers, universities and studios stays with Yauga's team, and the people who join through it get a source tag and the same welcome as everyone else.

Loops

A Loop is a short sequence of emails to one member. It starts from something they did, or did not do, and stops the moment they take the step it asks for, so nobody is chased for something they have already done.

Welcome

Starts when		What it sends		Stops when
Someone joins a city's waitlist or Yauga Letters through an	→	One email on what they will get, pointing at their city's next event or their place on the waitlist	→	On confirmation, and nothing goes to an address that has not confirmed

OnchainSuite form and confirms by email		

After the Haus

Starts when	What it sends	Stops when
A check-in at a Haus	That evening, one email pointing at the app with a first practice for their focus	They open the app and start a practice

First practice

Starts when	What it sends	Stops when
A member joins in the app	A first practice for their pillar, then how to set up the ring and start a streak	They complete a session or pair the ring

Slipping

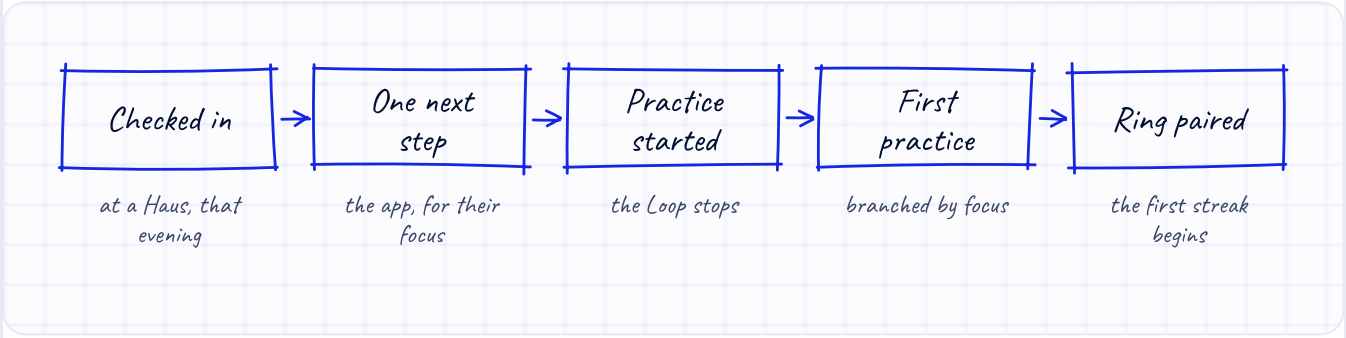

Starts when	What it sends	Stops when
Yauga sends member_quiet as the member moves to At risk	The next shared sit in their city, with the date, and nothing else	They check in or complete a session

Bring someone

Starts when	What it sends	Stops when
A third check-in, when a member is a regular	One email with a guest pass for someone they would like to bring	A referral is made

Dormant

Starts when	What it sends	Stops when
60 days without a check-in, a session or a streak	One good reason to come back	After that one email, and then we leave them alone

> **Live experiences bring people in. This is how they find the app after they go home.**

How every Loop behaves

It starts from a fresh event each time, because on OnchainSuite a member enters a "joined a segment" flow only once, ever

It stops the moment the member takes the step it asks for

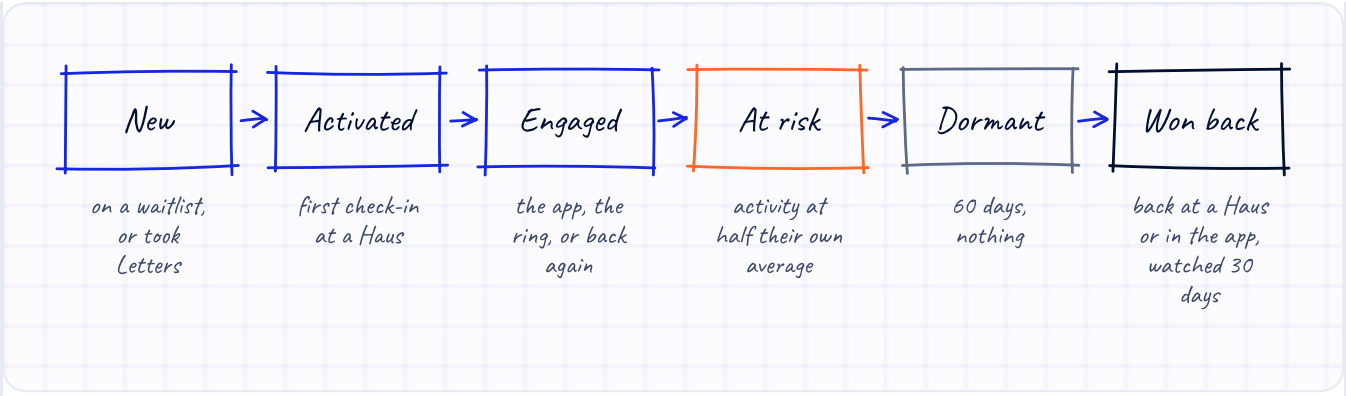

One owner per moment, so nobody gets two emails about the same thing

Email is the only member channel: OnchainSuite's in-app messages and push need a wallet sign-in, which Yauga's members do not use, so the Yauga App keeps its own push

One broadcast a week is the cap, and retention triggers are the exception

Lifecycle

Every member sits in one of six stages, the same six on every strategy we run. The stage is worked out from what the member did across every Yauga product, never set by hand, and it is read by city and by focus; it moves on patterns, while retention triggers answer single events, and the two never overlap.

Stage	What it means	What moves them on
New	On a waitlist or taking Letters, with no check-in yet	The launch campaign and the welcome Loop
Activated	A first check-in at a Haus	The after-the-Haus Loop
Engaged	Practising in the app, a paired ring, a membership or a second check-in	No Loop: streaks, points, Letters and the city's campaigns
At risk	Activity at half their own 30-day average	The slipping Loop
Dormant	60 days with nothing	One email, then rest
Won back	Back at a Haus or in the app from At risk or Dormant	Watched for 30 days, then Engaged or At risk, never back through the welcome

The one rule for At risk

Activity at half the member's own 30-day average, counted across check-ins, sessions and streaks. OnchainSuite's built-in scores are designed for wallets, so Yauga works it out from its own data and sends it as member_quiet.

Exit points

An unsubscribe stops Letters, launches, city news and every Loop, and reaches HQ Control by webhook the same day; tickets and receipts still come from Haus OS

A spam complaint stops everything that day, and a hard bounce closes the address

A cancelled membership is a retention trigger, not an exit

An account deleted, or an erasure request, ends everything, the record included

Retention triggers

A retention trigger is one email, sent the same day something happens to a member's own account. It comes from the event rather than a calendar, carries no offer, and goes to anyone the event belongs to, with or without the letters tag, because it is about something they did.

Moment	The email
A streak reached or a challenge completed	Notices it, says what it earned and offers one small next practice; Yauga works out the streak and sends only the milestone
Points within reach of a reward	Says how close they are, with the next Haus in their city
The ring gone quiet	Says it has stopped syncing, and how to get it going again
A membership cancelled	What changes, what stays and how to come back, with no offer
Two days before an event	Only if Haus OS sends reminder_due; otherwise the ticket campaign carries it

Here is the after-the-Haus email, the one every other automation depends on, written to pass the Yauga Test.

After a first check-in, email

Subject **What to do with tonight**

Preview One practice for sleep, in the app, before you go to bed

You were at Yauga Haus Vienna tonight. Thank you for coming.

What you felt in the room can be practised at home. The Yauga App has a first practice for sleep that takes eleven minutes, and it works best tonight, while the evening is still with you.

Sign in with the same email and the practice is waiting for you, along with the first day of your streak.

Open the app

How we know it worked

Bookings, check-ins, practice, streaks and points are counted from Yauga's own events rather than from the estimates in OnchainSuite's automation reports, and every always-on Loop keeps a holdout, a small group left out on purpose, so we can show what the strategy caused.

Opens are a health check. The goal is movement round the loop.

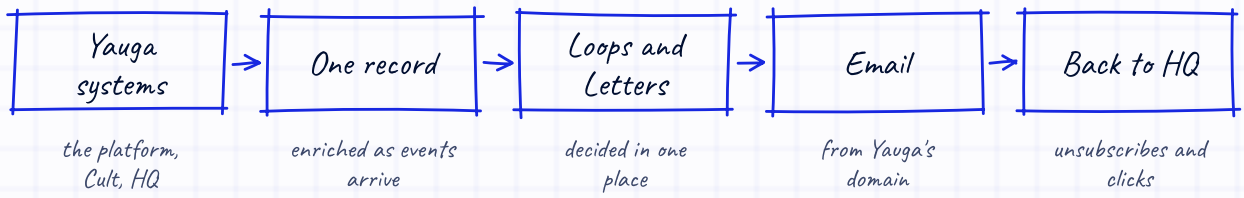

Every Monday a stage report shows how many members sit at each stage, by city and by focus, and the stage where most of them are stuck is where the next week's effort goes. Under it sit six numbers, with targets set once the first month gives us a baseline:

- The share of website sign-ups who come to a first Haus
- The share of first-time attendees who join the app or take a membership
- The share of members who keep a streak going each week
- Points spent on Haus tickets, and repeat check-ins per member
- How complete each member's record is, from city and focus to formats and goal
- Unsubscribes and spam complaints, which should stay low and flat

Running it on OnchainSuite

OnchainSuite is the layer that holds the member record and sends the communication. Every Yauga system sends its events straight to it from Yauga's server, with a secret key, so a follow-up can go the same day as a check-in, and each system is wired once, after which new emails are built in OnchainSuite with no further developer work.

System	What it reports
Yauga App and Haus OS	A waitlist joined, a ticket booked, a check-in, a membership, a session or challenge, points earned and spent, and an order
Yauga Cult	The ring paired, a streak reached and the ring inactive
Yauga HQ	A member gone quiet and a referral made, worked out from Yauga's own data
Website	Sign-ups, through an OnchainSuite form with double opt-in
Enterprise and connected products	A source tag now, and their own events when they are ready
Back to HQ Control	Unsubscribes and clicks, by webhook

One record per person is found by email first and Yauga member ID second, and tagged as events arrive with who they are, their city, their focus and pillar, the formats they use and their state. Tags keep a group such as "Vienna, sleep focus" current without anyone rebuilding it, and groups that depend on history are built as SQL segments from the event log.

What the platform does today	So the plan
A member enters a "joined a segment" flow once, ever	Repeating moments start from fresh events
An automation cannot wait until two days before an event date	Pre-event emails go as a campaign to the event's ticket tag
The segment builder reads tags, a score and a wallet	Meaning goes into tags at the source, and history uses SQL segments
The engagement and churn scores are designed for wallets	"Quiet" comes from Yauga as member_quiet
Date triggers run on one team time zone	City sends are scheduled separately
Conversion figures in automation reports are estimates	Outcomes are counted from Yauga's events

Events are live, while nightly files arrive too late to start a flow and events older than seven days are refused, so an import is for Yauga's existing history only. The plan is sized to contacts, Launch at 2,500 and Growth at 25,000, and OnchainSuite brings the event list and tag scheme, the segments and automations built and tested, Yauga Letters structured by focus and city, reporting on the loop, and a team working on the whole strategy alongside Yauga's.

What we need from Yauga, and what we never send

Six things before anything is wired:

- The front door fields on the website and booking forms: name, email, city and focus, with phone optional
- A developer to connect the platform, the ring and HQ once
- An opt-in tick at booking and at app sign-up

- City and focus values sent the same way from every system
- A points balance in the app, with what earns and what spends set by Yauga
- HQ Control listening for unsubscribes, and the city leads' news sent to HQ, never out from the city

Then, before anything goes out:

- The event names confirmed by Asif, since they are a working draft
- The spelling of "Yauga Cult" confirmed with Kris
- The sending domain and who manages its DNS, because SPF, DKIM and DMARC decide between inbox and spam
- Who approves each email, and whose voice it goes out in

What we never send: the Yauga rules

- Body readings, from sleep and heart rate to HRV, stress and SpO_2, never leave Yauga's systems and never earn points; OnchainSuite only hears that something happened
- No marketing to anyone who has not said yes: a ticket buyer gets their ticket, and every automation checks for the letters tag
- One broadcast a week, and since OnchainSuite has no built-in limit on how often one person is emailed, that rule is the limit
- Nothing that is not secular, and anything at 40 or above on the woo-woo scale is rewritten or cut
- City leads never send their own emails, and receipts stay in Haus OS, where they already work

Everything we do send passes the Yauga Test, which asks whether it can be felt, practised and explained plainly, and comes from one sender with one standard in every city, while practitioners, city leads and partners sit on a separate list.
